

# Object Oriented Programming

Rajasekaran. S  
Assistant Professor  
Dept of IT

# Object Oriented Programming

- ♦ It is a software design methodology.
- ♦ It is a software programming model that constructed around objects.
- ♦ It aims to implement real world entities in programming.

# OOP Languages

- ♦ The programming languages that follows the oops principles is known as object oriented programming languages.
- ♦ Examples
  - ♦ Simula, C++, Python, JAVA.

# OBJECT

- ♦ Object is specific instance of a class.
- ♦ It is often referred as a “Real world Entity”.
- ♦ It lives in computer memory.
- ♦ It has real values.
- ♦ Objects of the same class need not be a same.
- ♦ Shares similarity with attributes but differs with values.

# CLASS

- ♦ It is template definitions of methods and variable.
- ♦ Class is blue print of Object.
- ♦ Class should be instantiated before using.

# 4 Principles of OOP

- ♦ Abstraction.
- ♦ Encapsulation.
- ♦ Inheritance.
- ♦ Polymorphism.

# Basic Terminologies

- ◆ **Object**

- ◆ A real world entity.
- ◆ It is a instance of a “class”.
- ◆ It contains a attributes [properties] and functions [methods].

# Example of an Object

Properties	Methods
Colour	Start, Stop
Transmission Type	Accelerate
Max Speed	Change Transmission

# Basic Terminologies

- ♦ **Class**

- ♦ It is a template for an object.
- ♦ It is used to describe more than one object.
- ♦ A class is an extensible program-code-template for creating objects.
- ♦ Classes are help us to create multiple objects from them.

# Car Class

- ♦ What are the fundamental differences between cars.

# Abstraction

- ♦ It is used to manage the complexity of the program.
- ♦ Hiding unwanted information from users.
- ♦ Hiding internal working mechanism from user.

# Abstract Car

- ♦ How much user must know about the car for safe operations?

# Basic Terminologies

- ◆ **Encapsulation**

- ◆ It is containment of code and data together.
- ◆ It is used to protect the unnecessary external access of code and data from other source.
- ◆ Parts of the program wrapped individually without affecting each other.

# Encapsulated Car

- ♦ Individual System's in a typical car.
- ♦ The Transmission System and Music System is independent to each other.
  - ♦ Transmission System.
    - ♦ Engine Speed
    - ♦ Gear Ratio Change.
    - ♦ Clutch On/Off.
  - ♦ Music System.
    - ♦ Play/Stop
    - ♦ Album Change
    - ♦ Source Change [AUX/CD/USB]

# Basic Terminologies

- ◆ **Inheritance**

- ◆ Reuse the code.
- ◆ Sharing the characteristics or properties among the objects.
- ◆ Parent and Child Relation
- ◆ Support the Hierarchical classification

# Inherited Car

- ♦ Think about similarities and differences.

# Basic Terminologies

- ♦ **Polymorphism**

- ♦ Taking more than one form.
- ♦ it describes the concept that objects of different types can be accessed through the same interface.

# Polymorphic Steer Wheel *[Car vs Aircraft]*

Thank You !!!
